Sep. 19-22, Toulouse, France

Outline

 **Motivation**

 **Definitions**

 **Methodologies**

 **The Taxonomy**

 **Validation and Assessment**

 **Discussions**

Motivation (con't)

- ❑ A good defect classification is necessary for every organization
 - Necessary for communication between developers, code reviewers, quality assurance engineers
 - Process improvement, e.g., defect prevention

Motivation (con't)

□ What is a “good” defect taxonomy

- Functionality: capture “what’s wrong” with a piece of code or document
- Inter-coder reliability: the degree to which different people classify a defect into the same category

□ What features determine inter-coder reliability

- Orthogonality ↑
- Complexity ↓

Motivation (con't)

- ❑ **A practical need in the Chinese Aviation industry**
 - A rigorous process for assuring software quality
 - Software certification tests are conducted by qualified and independent third-party software testing centers
 - A defect taxonomy that should be easily understood and made consensus between multiple stakeholders, e.g. user representatives, developers, project managers, domain experts, and software certification testing engineers.

- ❑ **Current classification**
 - Documentation, Program, Design, and Others.

- ❑ **Why not the widely reported classifications, e.g. ODC?**

Definitions

❑ Defect

An incorrect or missing step, process, or data definition in software, including computer programs and documentation (adapted from the definition of “fault” in the IEEE Standard Glossary of Software Engineering Terminology [8]).

❑ Defect Form (DF)

The way how a snippet of software (including computer programs and documentations) is being a defect. Note that the Defect Form here is not the same as the “Defect Type” concept commonly used in software engineering, e.g. in “Orthogonal defect classification” [1]. Defect Form describes “what” a defect is, in more detail than “Defect Type”.

Outline

 **Motivation**

 **Definitions**

 **Methodologies**

 **The Taxonomy**

 **Validation and Assessment**

 **Discussions**

Methodologies

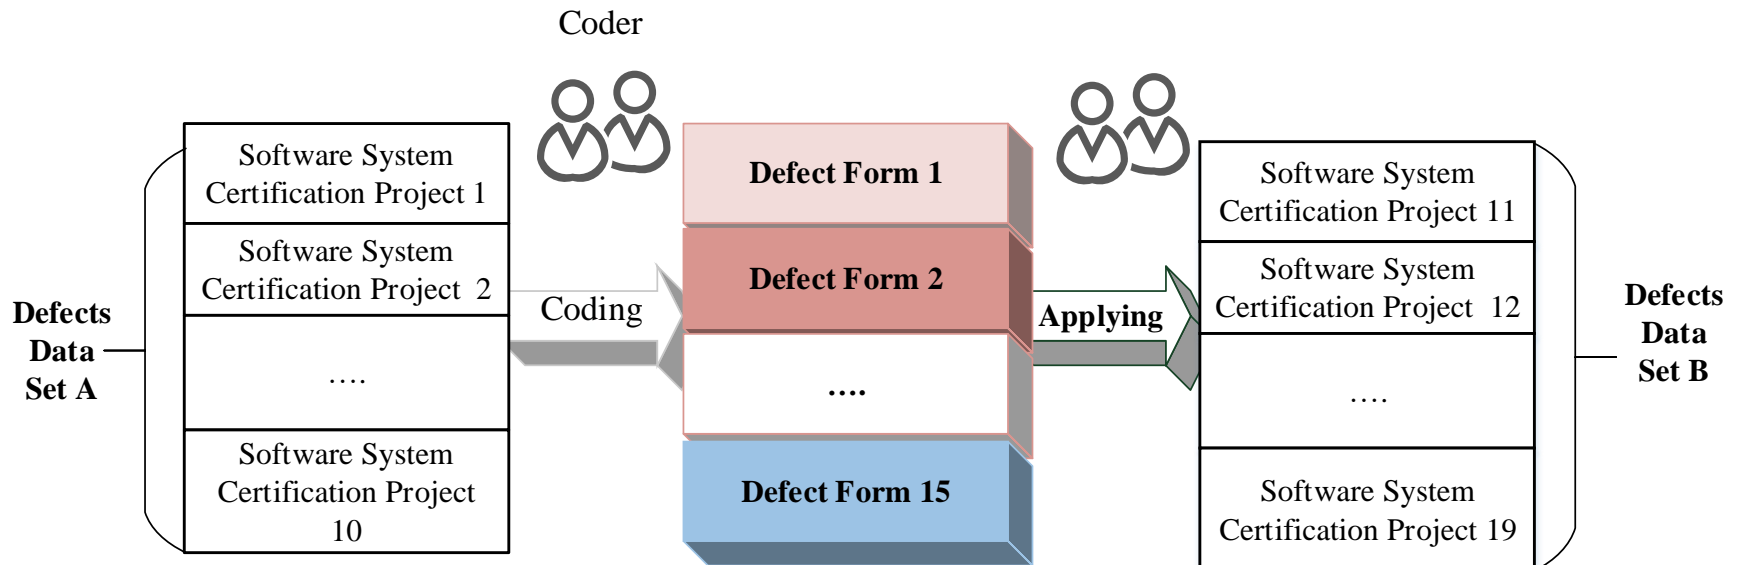

❑ Predetermined vs. Finding patterns in real data

❑ Grounded Theory

- Grounded Theory, initially developed by Glaser and Strauss [9], is a methodology used to build new theories based empirical data. The methodology involves a set of strategies
- Inductive and iterative process to generate a new theory from empirical data
- Open Coding

Methodologies (con't)

❑ The Process

Methodologies (con't)

❑ The Data

| # | Software | LOC | # Defects found in certification tests | | | |
|--------------|------------------------------|--------|--|-------|---------|-------|
| | | | Critical | Major | Regular | Minor |
| 1 | Flight management CPU | 75572 | 0 | 1 | 5 | 0 |
| 2 | Flight Management MIO | 9692 | 1 | 0 | 6 | 0 |
| 3 | Inertial Navigation Software | 26406 | 0 | 1 | 13 | 0 |
| 4 | Inertial Attitude Software | 18361 | 0 | 3 | 1 | 2 |
| 5 | Anti-jamming all-in-one | 21683 | 0 | 0 | 6 | 9 |
| 6 | Radio Altimeter Software | 7572 | 1 | 2 | 0 | 0 |
| 7 | Task management software | 20353 | 0 | 2 | 35 | 3 |
| 8 | Power management | 21947 | 0 | 4 | 3 | 0 |
| 9 | Integrated monitoring | 49450 | 0 | 0 | 18 | 3 |
| 10 | Portable Maintenance Aid | 27314 | 0 | 3 | 2 | 0 |
| Total | | 278350 | 2 | 16 | 89 | 17 |
| | | | 124 | | | |

Outline

 **Motivation**

 **Definitions**

 **Methodologies**

 **The Taxonomy**

 **Validation and Assessment**

 **Discussions**

The Taxonomy

▣ Thirteen Defect forms

| Defect form | Number of defects | Percentage |
|---|-------------------|------------|
| DF6-Inconsistency between program function and requirements specification (II) (fixed by changing the program) | 35 | 28% |
| DF5-Inconsistency between requirements specification and program function (I) (fixed by changing requirements documents) | 19 | 15% |
| DF1-Useless requirements specification | 13 | 10% |
| DF9-Algorithm error | 11 | 9% |
| DF12-Exception handling Error | 10 | 8% |
| DF11-Missing function | 10 | 8% |
| DF8-Calculation error | 9 | 7% |
| DF2-Missing requirements specification | 8 | 6% |
| DF3-Inappropriate organization of the requirement specifications | 2 | 2% |
| DF10-Assignment error | 2 | 2% |
| DF13-Annotation error | 2 | 2% |
| DF7-Ambiguous requirements specification | 2 | 2% |
| DF4-Incorrect requirements specification | 1 | 1% |
| Total | 124 | 100% |

 **Discussions**

Validation

❑ Participants

5 experienced software certification testing engineers, all of whom held team leader positions

❑ Procedures

- The participants used the defect form list to reclassify the defects they had found in the projects they were actively involved in.
- We also added another category, DF14-Others, to the list to identify any defects that could not be classified using the 13 forms.
- They were encouraged to raise any issues if there were any unclear definitions or any defects that could not be classified by the taxonomy.
- We asked them whether they had encountered any defect that could be classified by more than one defect form to evaluate the degree of mutual exclusivity between the defect forms.

Validation (con't)

❑ The Validation Data

| Software systems | Critical | Major | Regular | Minor | Total |
|------------------|----------|-------|---------|-------|-------|
| CJGZKZ | 4 | 0 | 6 | 0 | 10 |
| JZCL | 5 | 0 | 0 | 0 | 5 |
| ZKGL | 9 | 0 | 16 | 6 | 31 |
| TXCL | 2 | 0 | 5 | 0 | 7 |
| HJGL | 1 | 0 | 13 | 1 | 15 |
| BFCC | 3 | 0 | 2 | 1 | 6 |
| IIS | 0 | 4 | 1 | 2 | 7 |
| DXX | 5 | 0 | 5 | 5 | 15 |
| JT | 7 | 0 | 63 | 3 | 73 |
| Total | 36 | 4 | 111 | 18 | 169 |

Validation (con't)

❑ The Validation Results

| Defect Forms | Doc | Prog. | Other | Total # | #% |
|--|----------------|-----------|----------|------------|------------|
| DF2 | 3 | - | - | 3 | 1.8 |
| DF5 | 64 | - | - | 64 | 37.9 |
| DF6 | 2 ^a | 38 | - | 40 | 23.7 |
| DF8 | - | 2 | - | 2 | 1.2 |
| DF9 | - | 4 | - | 4 | 2.4 |
| DF10 | - | 30 | - | 30 | 17.8 |
| DF11 | - | 8 | - | 8 | 4.7 |
| DF12 | - | 9 | - | 9 | 5.3 |
| DF13 | - | - | 6 | 6 | 3.6 |
| DF14 | 1 | 2 | - | 3 | 1.8 |
| Total | 70 | 93 | 6 | 169 | 100 |
| ^{a.} Comments in the program are inconsistent with requirements | | | | | |

Assessment

❑ Completeness

$$Completeness = \frac{\sum_1^{13} DF_i}{\sum_1^{14} DF_i} \times 100\% \quad (1)$$

where DF_{14} represents a defect was assigned to “other”. That is, Completeness is estimated based on the number of defects assigned to the 13 defined forms out of all defects.

- The taxonomy effectively covered 98% (166/169) of defects identified in the nine software certification projects.
- The participants utilized only 9 out of the 13 available defect forms

❑ Clarity and non-overlapping

- No issue was raised on these matters by the participants.

Discussions

❑ Contributions

- This paper proposed a new concept “defect form” to describe the patterns of defects found in certification tests in the Chinese aviation industry.
- We developed a taxonomy consisting of 13 defect forms derived from 10 software systems using Grounded Theory.
- The taxonomy were applied and validated by 5 independent professional certification testing engineers on another 9 software systems certification projects.
- Results show that nine defect forms were able to describe 98% defects.
